

# Racial Biases in COVID-19 Cases by NJ Populations

Figure 1: This graph shows the representation of COVID-19 cases by the populations in NJ as of 09/2020.  
The positive values are an over-representation of COVID-19 deaths in NJ by the population race distribution.  
The negative values are an under-representation of COVID-19 deaths in NJ by the population race distribution.  
As indicated by the graph, the hispanic and black communities are the most impacted by NJ's oppressive medical field.
